EDUCATION

B.S.B.A., Finance; B.A., Computer Science; Dual Degree **Graduated December 2025**
High Point University; GPA: 3.8; 8-time Dean's List recipient, President of the CODE Club High Point, NC

Technical Skills

- Python, TypeScript (incl. React), Java, C++, ROS2, SQL, Git, Docker

EXPERIENCE

Automation/Process Engineer **June 2022 – June 2024**
Merit Controls

- Optimized operational systems across multiple areas of the company, identifying process bottlenecks and implementing new workflows to improve engineering and business operations.
- Designed, re-engineered, and implemented a new purchasing framework that **increased engineer productivity by ~6 hours/week/engineer.**
- Developed automated workflows and software tools supporting sales, senior management, and company-wide alerting, eliminating repetitive manual processes.
- Created an electrical inverter simulator in Python that **is currently used on about 3% of US solar power facilities**.

Technology Development Program – Engineering **February 2026 - Current**
PNC Financial Services

- Rotated across engineering and technology teams, supporting production software deployments and solving technical problems across business domains.
- Developed production features for PNC Asset Management using Angular/TypeScript and Java, including a wire transfer feature that has processed more than $100M and customer-facing account dashboards.
- Worked with PNC's Fraud organization to monitor suspicious activity and develop parameter-driven alerting workflows; gained experience working with IBM z/OS mainframe systems.

Internships

- Full Stack Developer & Internal Audit Intern at PNC Bank (2024 & 2025)
- Valuation Intern at Cofounders Capital (Venture Capital – 2021)

PROJECTS

- Collaborated with a team to design/build/present a full-stack fitness app [React/Python/MySQL/REST APIs] from scratch as a capstone for High Point's Computer Science program – finished 1st place.
- Since 2021, have worked for various startups, rapidly prototyping custom web apps & data tools in Python, TypeScript, C++, and other languages to validate product concepts.
- Currently developing a ROS2-based autonomous drone system to detect and follow a moving target; building simulation infrastructure to test navigation and control before deployment to physical hardware.
